

# Writing papers and thesis using $\text{\LaTeX}2\text{e}$

## Part I: Writing papers using $\text{\LaTeX}$

Krishna Kumar <sup>\*1</sup>

<sup>1</sup>King's College  
University of Cambridge

$\text{\LaTeX}$ for Beginners

---

<sup>1</sup>kks32@cam.ac.uk

## 1 Sections and subsections

- Sections
- Title and abstract
- Title and Abstract

## 2 Maths

- To generate sections in  $\text{\LaTeX}$ : `\section{name-here}`
- Subsection: `\subsection{name-here}`
- Subsubsection: `\subsubsection{name-here}`
- Subsections without numbering `\subsection*{name-here}`

```
\documentclass{article}  
\begin{document}
```

```
\section{Introduction}
```

The problem of \ldots

```
\section{Method}
```

We investigate \ldots

```
\subsection{Sample Preparation}
```

```
\subsection{Data Collection}
```

```
\section{Results}
```

```
\section{Conclusion}
```

```
\end{document}
```

## 1 Introduction

The problem of ...

## 2 Method

We investigate ...

### 2.1 Sample Preparation

### 2.2 Data Collection

## 3 Results

## 4 Conclusion

# Title and Abstract

Before you begin typing your document, i.e., `\begin{document}` you need to define the author name and title.

- Title of the document in L<sup>A</sup>T<sub>E</sub>X: `\title{name-here}`
- Author name: `\author{name-here}`
- Set a specific date: `\date{date-here}`
- How do you not print date: `\date{}`

This only defines what the title of the document, author name and date create. It does not print it. To print the meta-data, do `\maketitle` after begin document

# Title and Abstract

- Tell  $\text{\LaTeX}$  the `\title` and `\author` names in the preamble.
- Then use `\maketitle` in the document to actually create the title.
- Use the abstract environment to make an abstract.

```
\documentclass{article}

\title{The Title}

\author{A. Author}

\date{\today}

\begin{document}
\maketitle

\begin{abstract}
Abstract goes here...
\end{abstract}

\end{document}
```

The Title

A. Author

November 11, 2014

**Abstract**

Abstract goes here...

Argument	Possible Values	Default Value
Typeface Size	10pt, 11pt, 12pt	10pt
Paper Size	a4paper, a5paper, letterpaper, legalpaper executivepaper b5paper	letterpaper
Paper Orientation	portrait, landscape	portrait
Title Page	titlepage, notitlepage	titlepage
Equation Numbering	leqno	Right side
Equation Alignment	fleqn	Centered
Output Type	draft, final	final
Layout Type	oneside, twoside	oneside
Chapter Opening	openright, openany	openright
Columns	onecolumn, twocolumn	onecolumn

# Font types

## Font face

```
\emph{text}, \textbf{text}, \textit{text}, \texttt{text}, \textrm{text (roman)},  
\textsf{text (sans font)}, \textsc{TEXT}
```

## Font size

```
\tiny, \scriptsize, \footnotesize, \small, \normalsize, \large, \Large, \LARGE,  
\huge, \Huge
```

## Alignment

```
\begin{flushleft / flushright / center}  
...  
\end{flushleft / flushright / center}
```

# Exercise 4: Sections

- Add title, author and print date
- Set font size to 11 pt
- Create sections and subsections

Click to open this exercise in **Overleaf**

- Hint: Don't forget to do `\maketitle` and don't forget `begin{document}` and `end{document}` [click here to see my solution](#).

## 1 Sections and subsections

- Sections
- Title and abstract
- Title and Abstract

## 2 Maths

- Why are dollar signs  $\$$  special? We use them to mark mathematics in text.

*% not so good:*

Let  $a$  and  $b$  be distinct positive integers, and let  $c = a - b + 1$ .

*% much better:*

Let  $a$  and  $b$  be distinct positive integers, and let  $c = a - b + 1$ .

Let  $a$  and  $b$  be distinct positive integers, and let  $c = a - b + 1$ .

Let  $a$  and  $b$  be distinct positive integers, and let  $c = a - b + 1$ .

- Always use dollar signs in pairs — one to begin the mathematics, and one to end it.
- $\LaTeX$  handles spacing automatically; it ignores your spaces.

Let  $y=mx+b$  be  $\ldots$

Let  $y = m x + b$  be  $\ldots$

Let  $y = mx + b$  be  $\ldots$

Let  $y = mx + b$  be  $\ldots$

- Use caret `^` for superscripts and underscore `'_'` for subscripts.

```
$y = c_2 x^2 + c_1 x + c_0$
```

$$y = c_2 x^2 + c_1 x + c_0$$

- Use curly braces `{` and `}` to group superscripts and subscripts.

```
$F_n = F_{n-1} + F_{n-2}$ % oops!
```

$$F_n = F_n - 1 + F_n - 2$$

```
$F_n = F_{n-1} + F_{n-2}$ % ok!
```

$$F_n = F_{n-1} + F_{n-2}$$

- There are commands for Greek letters and common notation.

```
$\mu = A e^{Q/RT}$
```

$$\mu = A e^{Q/RT}$$

```
$\Omega = \sum_{k=1}^n \omega_k$
```

$$\Omega = \sum_{k=1}^n \omega_k$$

# Inline equations

- If it's big and scary, *display* it on its own line using `\begin{equation}` and `\end{equation}`.

The roots of a quadratic equation  
are given by

```
\begin{equation}
x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} \;,
\end{equation}
where $a$, $b$ and $c$ are \ldots
```

The roots of a quadratic equation  
are given by

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} . \quad (1)$$

where  $a$ ,  $b$  and  $c$  are ...

Caution:  $\text{\LaTeX}$  mostly ignores your spaces in mathematics, but it can't handle blank lines in equations — don't put blank lines in your mathematics.

- You can add punctuations in your equation by adding `\,` to add a period and `\,`, to add a comma at the end of the equation.

## Ex 5a: Maths

- Make sure inline equations are within the mathmode  $\$...\$$
- Format these two equations:

$$i\hbar \frac{\partial}{\partial t} \Psi(r, t) = \left[ \frac{-\hbar^2}{2\mu} \nabla^2 + V(r, t) \right] \Psi(r, t),$$

$$E^2 = (pc)^2 + (m_0 c^2)^2.$$

Click to open this exercise in **Overleaf**

- To format math you need to use `equation` environment
- Use detexify to find out what the symbols are

<http://detexify.kirelabs.org/classify.html> click here to see my solution.

## Ex 5b: Maths

- Align equations as shown below:

$$y = ax + b$$

$$y + 1 = ax + (b + 1) \tag{2}$$

$$= ax + (b + 2) - 1 \tag{3}$$

$$y = ax + b$$

$$y + 1 = ax + (b + 1) \tag{4}$$

$$= ax + (b + 2) - 1$$

Click to open this exercise in **Overleaf**

- Insert cross references use `\usepackage{cleveref}`.
- Use `align` environment. To use this environment you need include `\usepackage{amsmath}` and `\usepackage{amsfonts}` packages.

click here to see my solution

# Never use equation arrays

- Use `align` instead of `eqnarray` when you have multiple equations.

```
\begin{eqnarray}
E &= m_0 c^2 \\\
E^2 &= (m_0 c^2)^2 + (pc)^2 \\\
\end{eqnarray}
```

$$\begin{aligned} E &= m_0 c^2, & (5) \\ E^2 &= (m_0 c^2)^2 + (pc)^2 & (6) \end{aligned}$$

```
\begin{equation}
E = m_0 c^2 \\\
\end{equation}
\begin{equation}
E^2 = (m_0 c^2)^2 + (pc)^2 \\\
\end{equation}
```

$$\begin{aligned} E &= m_0 c^2, & (7) \\ E^2 &= (m_0 c^2)^2 + (pc)^2. & (8) \end{aligned}$$

```
\begin{align}
E &= m_0 c^2 \\\
E^2 &= (m_0 c^2)^2 + (pc)^2 \\\
\end{align}
```

$$\begin{aligned} E &= m_0 c^2, & (9) \\ E^2 &= (m_0 c^2)^2 + (pc)^2. & (10) \end{aligned}$$
