

1 errors

I like L^AT_EX. If only it *liked* me.

2 Warnings

An overfull hbox means that there is a hyphenation or justification problem: moving the last word on the line to the next line would make the spaces in the line wider than the current limit; keeping the word on the line would make the spaces smaller than the current limit, so the word is left on the line, but with the minimum allowed space between words, and which makes the line go over the edge.

3 Underfull hbox warning see LogFile

This is a warning that LaTeX cannot stretch the line wide enough to fit, without making the spacing bigger than its currently permitted maximum. The badness (0-10,000) indicates how severe this is (here the badness is severe 100000). It says what lines of your file it was typesetting when it found this, and the number in square brackets is the number of the page onto which the offending line was printed. The codes separated by slashes are the typeface and font style and size used in the line. Ignore them for the moment.

This comes up if you force a linebreak, e.g., `\`, and have a return before it. Normally TeX ignores linebreaks, providing full paragraphs of ragged text. In this case it is necessary to pull the linebreak up one line to the end of the previous sentence.
